

B L H D WEEK 3

This Week:

TV	Platelets
AT	Coag System + Coag Regulation
TV	Bleeding Disorders I
TV	Bleeding Disorders II
AT	Hemophilia
AT	Transfusion Medicine I
AT	Transfusion Medicine II
TV	Thrombosis
TV	Anticoagulants
AT	Pathology of Gunshot Wounds

WHAT KEEPS US from BLEEDING OUT?

1. PLATELETS

1° HEMOSTASIS - temporary, dislodged

no nuclei, tiny cytoplasmic fragment, sx: petechiae, mucosal bleeding (gums, epistaxis)

responds to Ca²⁺

of which white blood cell?

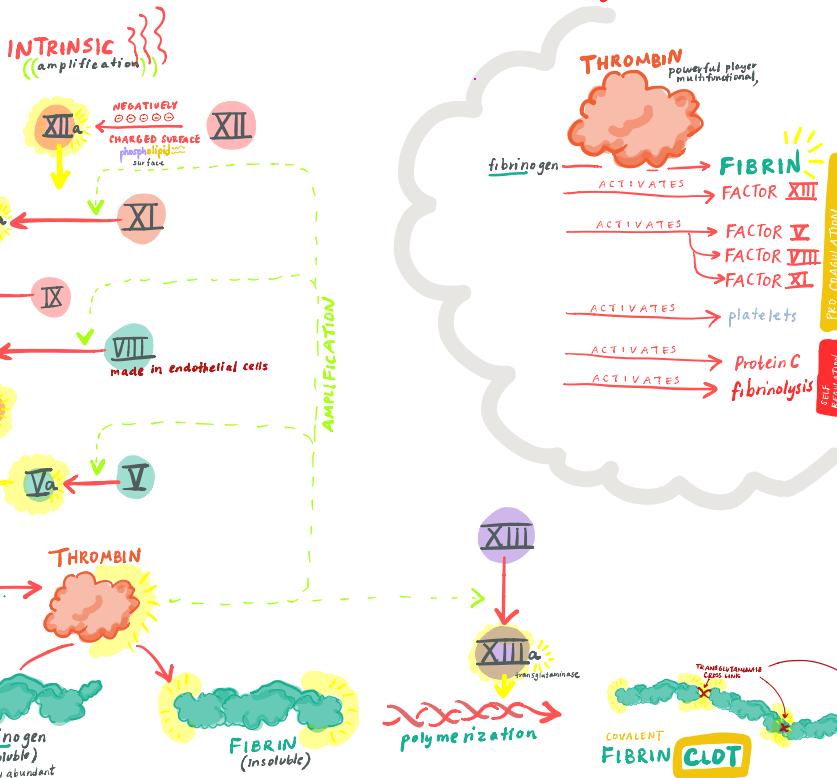

2. COAGULATION

2° HEMOSTASIS

cascading signal of factors (serine proteases) (cofactors) that activate the subsequent factor to initiate wound healing, stop bleeding

fibrin-based

sx: deep bruising, ecchymoses, bleeding into joints

$$2 + 7 = 9 \text{ and } 10$$

Protein C the essential role of Protein S Vitamin K in CLOTTING & HEMOSTASIS

CYP2C9 P450 enzyme

warfarin

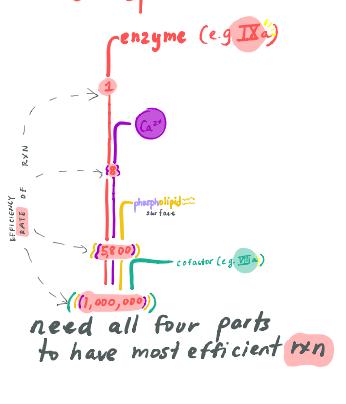

VKORC1 helps replenish supply of VITAMIN K

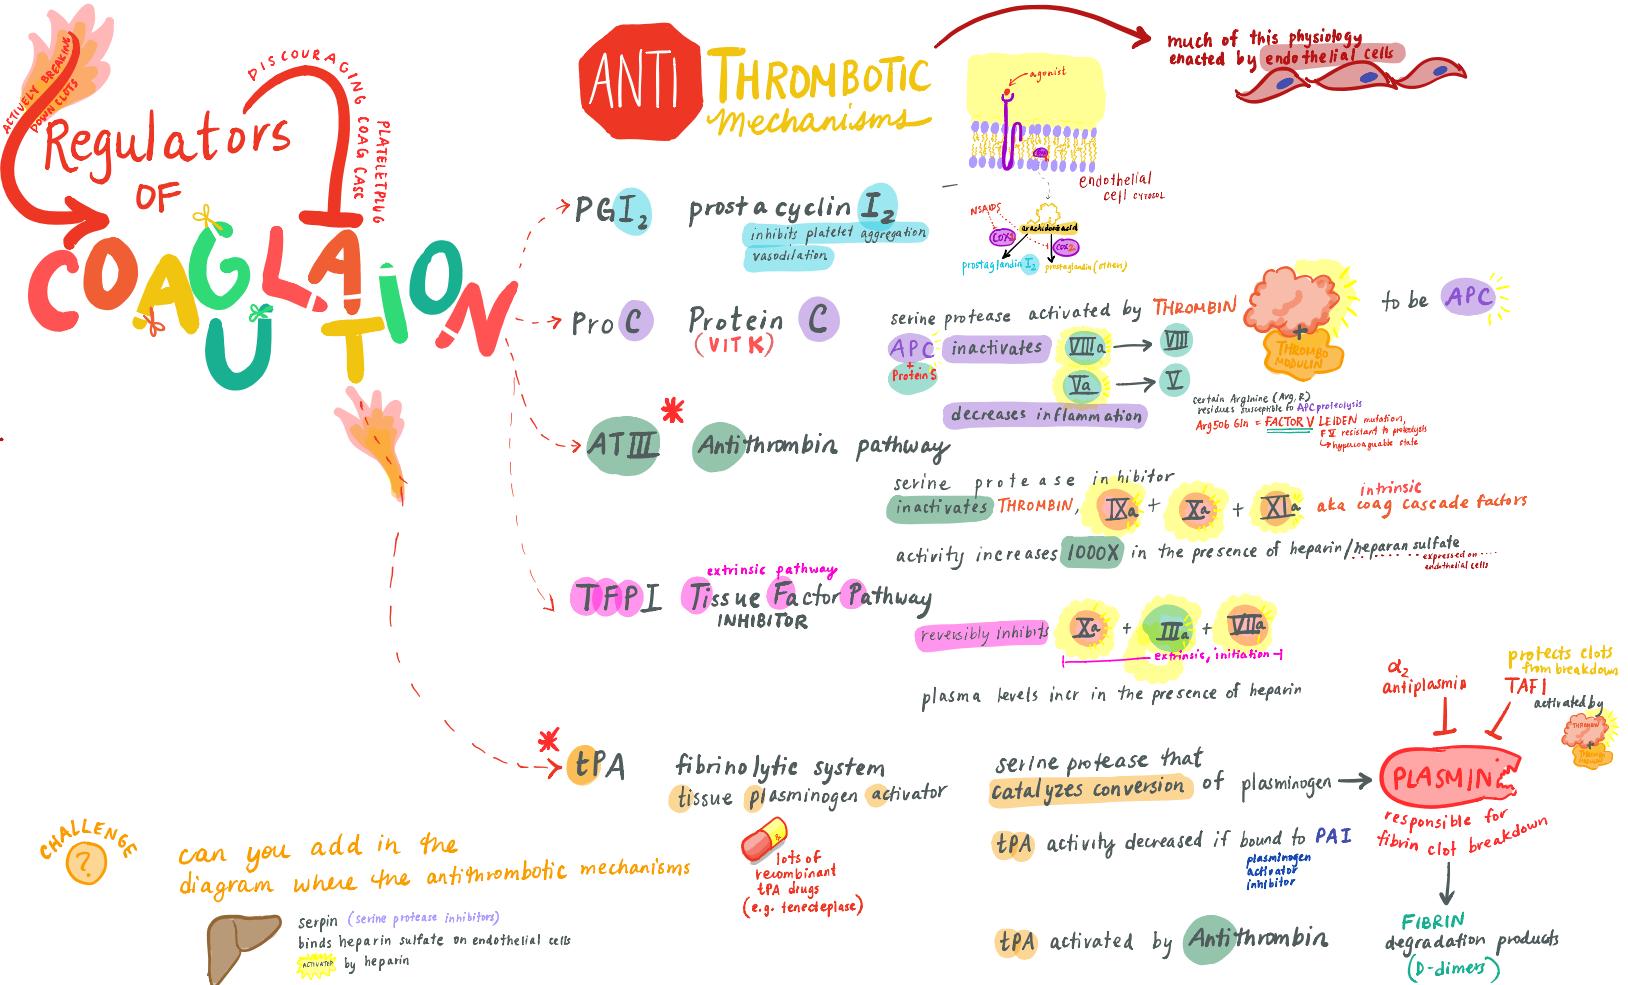

allows for the gamma-carboxylation of clotting factor residues

QUATERNARY complex

Hemophilia

X-LINKED RECESSIVE

but can also be acquired (30%)

↓
cancer
pregnancy
rheumatologic dz

which deficiency is most common?

HOW MUCH FACTOR DO you need to give?

<1%:
GETTING TO ABOVE 1% IS A HUGE DEAL

SEVERE
hemophilia

Spontaneous bleeding into joints (hemarthrosis) + muscle

NEW tx:

MODERATE
hemophilia

Bleeding w/ trauma or surgery
rare spontaneous bleeding

6-50%:
MILD hemophilia

Bleeding w/ trauma or surgery

A
hemophilia
VIII deficiency

tx: FACTOR VIII
t_{1/2} = 12 hours
1 unit → 2% level incr

B
hemophilia
IX deficiency

tx: FACTOR IX
t_{1/2} = 18-24 hrs
1 unit = 1% level incr

C
hemophilia
XI deficiency
Ashkenazi Jewish ancestry

tx: FACTOR XI

! Try drawing out as much of the regulators of coagulation here
lack of soluble fibrin clot formation
uncontrolled deep bleeding, severe cases into joints, muscles, long term damage

? What labs would you check?

& what would you expect to see?

? How would we distinguish absence of factor (VIII) vs presence of factor inhibitor? What lab/test would distinguish?

KEY POINT!!

Complication: FACTOR INHIBITORS

ANTIBODIES w/ SPECIFICITY AGAINST FVIII OR FIX → get destroyed or make giving factor ineffective

TRANSFUSION COMPONENTS

	INDICATIONS	TYPICAL	SEVERE
refrigerated → last 42 days kept @ RT → last 4 days slow infusion speed over 2-4 hrs	RBCs Hct < 21% OR Hgb < 7 OR Acute coronary syndrome OR documented symptomatic anemia	1 unit Hct incr ↑ 3% 2 units clotting factors incr ↑ 5%	6 units if Hct < 18 4 units INR = 2 to 2.5 6 units INR > 2.5
What is the largest component of plasma? Next largest?	Frozen Plasma INR > 1.5 prior to major procedure OR if bleeding OR TTP, low clotting factor levels, DIC	use of FFP @ risk of multiorgan system failure acute lung injury (TRALI)	relative contraindications TTP (?) genetic defect associated w/ TTP = & Heparin-induced thrombocytopenia (HIT) what form of heparin is less likely to cause HIT
fibrinogen (+ FVIII, FXIII, VWF) expires 5-7 days store room temp (20°-24°C) MUST ROCK GENTLY! at risk for bacterial growth	"Cryo" precipitate (thaw of FFP) Platelets (platelets) fibrinogen < 150 AND PATIENT IS BLEEDING rarely FXIII deficiency < 10 + prophylactic < 20 + minor procedure < 50 + major surgery < 100 Neurosurgery	10 units fibrinogen incr ↑ 50 mg/dL 1 unit mL/kg platelets incr ↑ n 30K/uL	20 units fibrinogen < 50 2 units platelets < 50

Confirming BLOOD COMPATIBILITY BEFORE we transfuse

- Type and Screen
- Antibody Screen allo
if no ↓ if yes auto
- Antibody Identification self autoimmune carries TTP attacks cell & disrupts platelets
- Cross match

Massive TRANSFUSION PROTOCOL

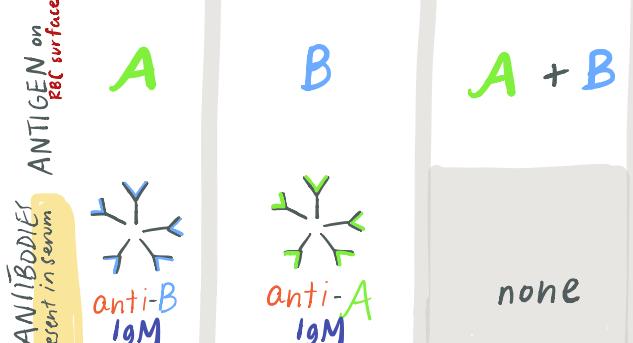

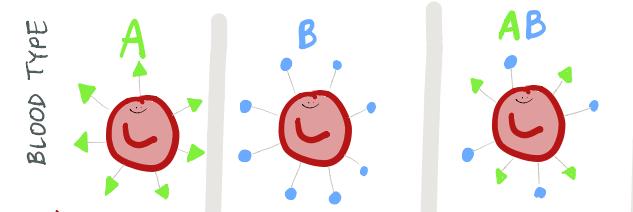

6 : 6 : 1
12 UNITS RBC : 12 UNITS PLASMA : 1 UNIT PLATELET

→ PROTOCOL @ HOSPITAL THAT ENSURES THIS RATIO OF BLOOD PRODUCTS CAN BE DELIVERED < 10 min

Dilution unequal #s of blood components

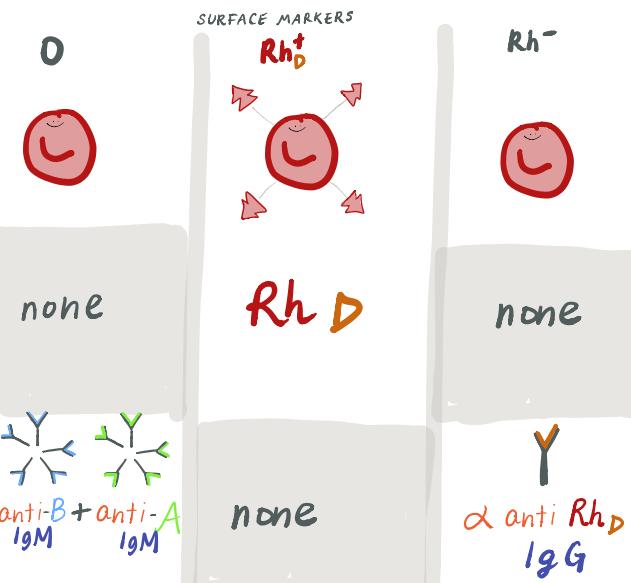

! Be able to understand the result of giving an imbalanced proportion of blood products

ABO SURFACE MARKERS

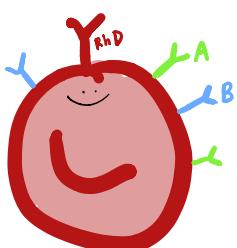

B or AB transfusion → HEMOLYTIC RXN
A or AB transfusion → HEMOLYTIC RXN
can receive any blood type ABO
universal PLASMA donor
can receive any type of plasma

Rh SURFACE MARKERS

but can only receive O blood
UNIVERSAL RBC DONOR
can receive any blood type Rh+ or Rh-
Treat mother w/ anti-D Ig during and after each pregnancy to prevent anti-D IgG formation
can receive any type of plasma

What constitutes a Blood group antigen?
What are the two most consequential Blood group Antigens?

HOW DO WE DETERMINE BLOOD TYPE + presence of Ab in blood?

what is CODOMINANCE

how does it compare with other modes of inheritance? NO dominant trait, distinct from autosomal/x-linked recessive, masked by if you express the marker, that defines your blood group phenotype

A	B	O	
A	AA	AB	AO
B	AB	BB	BO
O	AO	BO	OO

genotype Table → Blood Group phenotype

PATHOLOGY of GUNSHOT WOUNDS

fire arm-related injuries = public health epidemic

1. understand forensic pathology
2. CAUSE vs MANNER of death
3. basic workup/understanding of firearms & associated WOUNDS

CAUSE of death

the injury or condition that started the fatal chain of events
etiologically specific

- exsanguination
- loss of fxn
- dysrhythmia (heart)
- ischemia
- infxn

WHAT info is important?

- 1 entrance → exit
- 2 range of fire
- 3 pathway & direction
- 4 bullet (type?)

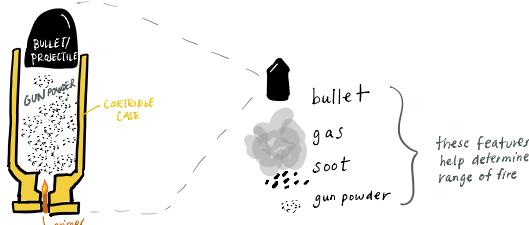

- 1 entrance WOUNDS** vs **exit WOUNDS**
- ✓ round / oval
 - ✓ "punched out"
 - ✓ present abrasion collar
 - ✓ gunshot residue
 - ✓ bullet travels in straight line unless deflected (tissue density, elasticity)

GRAZE WOUNDS
looks like abrasion
skin tags determine direction
contact wounds often stellate

MANNER of death

categories → UNDETERMINED

- HOMICIDE
- SUICIDE
- ACCIDENT
- NATURAL

these features help determine range of fire

GUNSHOT WOUND

- **PROJECTILE** bullet fired into body from firearm leading to serious physical & psychoemotional injury, and very often death.

Workup of GUNSHOT WOUND

- often by state medical examiner (MD)
1. determine entrance → exit
 2. describe visible residue for range of fire determination
 3. document injury including blood collections
 4. Recover bullets

SOLUTIONS?

- ✓ safe storage counseling to patients who own firearms
- ✓ gun access in home
- ✓ understand as physicians our role in preventing fire arm-related injuries — SHARE our stories, advocacy

other sx:

MULTIPLE INTERSECTING CALVARIAL FRACTURES IN SKULL
ORBITAL PLATE FRACTURES → RACOON EYES (periocular hematomas)
