

1 **TITLE**

2 Design Thinking – A Framework to Teach Innovation for Graduate Medical Education.

3

4 **ABSTRACT**

5 **Background**

6 Human-centered design (HCD) provides a novel approach for problem solving complex

7 medical problems through the lens of Quality Improvement (QI).

8

9 **Objective**

10 To demonstrate how a QI project applied HCD principles to redesign an emergency  
11 department sign-out process, creating a solution that was feasible, sustainable, and desirable.

12

13 **Methods**

14 This single-center project (2022–2023) engaged emergency medicine residents and  
15 attendings, along with consultants from neurology, surgery, and internal medicine. Using a  
16 Design Thinking (DT) framework – Discovery, Interpretation, Ideation, Experimentation, and  
17 Reiteration – we combined surveys, direct observation, and a literature review to inform  
18 design. Two structured brainstorming sessions synthesized findings and guided prototype  
19 development.

20

21 **Results**

22 Within three weeks, we implemented a streamlined sign-out template that improved  
23 workflow and communication. Qualitative feedback indicated strong user satisfaction and  
24 perceived efficiency gains.

25

1 **Conclusions:**

2 HCD and DT provide practical, learner-friendly tools for QI projects in GME, enabling rapid,

3 user-centered innovation.

4

## 1 INTRODUCTION

2 Quality improvement (QI) is a cornerstone of graduate medical education (GME) and  
3 requires addressing complex, system-level challenges.<sup>1-2</sup> Human-centered design (HCD)  
4 offers a mindset and set of frameworks that program directors can use to guide learners in  
5 understanding problems and generating effective solutions.<sup>3-6</sup>

6

7 Despite its importance, many QI projects fail due to limited support, interprofessional  
8 friction, resource constraints, organizational rigidity, and gaps in methodology.<sup>7</sup> Traditional  
9 QI approaches often rely on rapid-cycle change but rarely refine solutions before  
10 implementation.<sup>8-9</sup> For innovation to succeed, it must meet three criteria: feasibility,  
11 sustainability, and desirability.<sup>3</sup> HCD prioritizes desirability by deeply understanding user  
12 needs while integrating feasibility and sustainability throughout the design process. This  
13 iterative, user-centered approach can lead to impactful and lasting improvements.

14

15 Design Thinking (DT), a widely used HCD framework in healthcare, consists of five stages:  
16 Discovery, Interpretation, Ideation, Experimentation, and Reiteration.<sup>10-11</sup> It emphasizes  
17 stakeholder engagement and employs both divergent and convergent thinking strategies.<sup>12-13</sup>  
18 Studies show that even novice teams using DT can generate solutions for complex  
19 problems.<sup>14</sup> For example, DT has been applied to redesign the liver transplant allocation  
20 system, with 73.8% of participants agreeing it could address complex health system  
21 challenges.<sup>15</sup>

22

23 Despite these successes, published examples of DT applied to healthcare remain limited. This  
24 report illustrates how DT was used in a QI project to redesign an emergency department (ED)

1 sign-out process. Our goal is to provide educators and learners with a practical example of  
2 applying DT principles to improve clinical workflows within GME.

3

#### 4 **METHODS**

5 We conducted a QI project to redesign the ED sign-out note template using a DT framework.

6 At our institution, sign-out typically involves two to eight patients and is performed by a

7 team consisting of one attending and one to two residents. This project was deemed IRB-

8 exempt. Four physicians (two emergency medicine (EM) residents and two EM faculty)

9 served as primary investigators and managed the process using Miro Board.<sup>16</sup> Figure 2

10 illustrates the milestones and tasks completed during the design and implementation phases

11

#### 12 **Discovery**

13 We began with primary and secondary research.

14 • Primary research included surveys and direct observation of the sign-out process. End  
15 users – EM residents, EM attendings, and resident consultants – were selected.

16 ○ A five-question free-text survey was distributed to EM residents and  
17 attendings via SurveyMonkey (Appendix 1).<sup>17</sup>

18 ○ A three-question free-text survey was sent to resident consultants from  
19 internal medicine, general surgery, and neurology as these services frequently  
20 interact with the ED.

21 ○ Observations of sign-out were conducted, and thematic analysis was applied to  
22 survey responses and observation notes.

23 • Secondary research consisted of a PubMed literature review (April 2023) using search  
24 criteria outlined in Appendix 2. Findings informed the design of low-fidelity

25 prototypes to ensure evidence-based components were included.

1

## 2 **Interpretation**

3 Investigators held an initial brainstorming session using Miro **Board** to generate a problem  
4 statement. This phase emphasized divergent thinking to explore contributing factors.

5 Techniques included:

- 6 • Sorting and condensing research findings
- 7 • Identifying patterns and insights
- 8 • Framing a point of view
- 9 • Defining the problem

10

11 Insights were organized into a “Mind Map.” We applied the “How Might We” method to  
12 reframe problems into actionable questions. For example:

- 13 • Problem: “It is cumbersome to click into the chart and wait for it to load.”
- 14 • Reframed: “How might we improve EHR navigation to reduce wasted time?”

15

16 The resulting problem statement guided subsequent phases.

17

## 18 **Ideation**

19 Two prototype templates, one brief and one detailed, were developed and tested with six EM  
20 residents (two from each of the three training years). These residents were selected as peer  
21 leaders likely to disseminate information. The lead investigator observed sign-out sessions  
22 and conducted interviews to gather user feedback. Prototypes were iteratively refined using  
23 convergent thinking techniques.

24

## 25 **Experimentation**

1 A second brainstorming session produced a single, consolidated sign-out template. This  
2 template was implemented department-wide with usage instructions. The initial five-question  
3 survey was repeated among EM residents and attendings to assess user experience (Appendix  
4 1).

5

## 6 **Reiteration**

7 A designated “Resident Champion” will oversee ongoing iterations of the template using the  
8 same design cycle to ensure continued alignment with user needs.

9

## 10 **RESULTS**

11 The initial five-question survey achieved response rates of 81% (27/33) among EM residents  
12 and 10% (5/49) among attendings. Thematic analysis revealed three key issues with the  
13 existing sign-out template:

- 14 1. It was cumbersome and time-consuming.
- 15 2. It required redundant information that did not enhance patient care.
- 16 3. Sign-out was frequently interrupted.

17

18 The three-question survey for consultants had a 100% response rate (3/3). Consultants  
19 reported awareness of the sign-out note and considered it an important communication tool  
20 between care teams.

21

22 From primary research, we developed a Mind Map (Figure 1) and generated the following  
23 problem statement:

24 *“We don’t have an issue with our note alone, but with our broader sign-out culture.*

25 *We need a more streamlined note and build a culture to protect sign-out time.”*

1

2 Three major themes emerged as opportunities for improvement:

- 3 1. Redesign the note template to reduce redundancy while meeting billing and  
4 communication requirements.
- 5 2. Ensure clear, actionable patient plans within the template for receiving physicians.
- 6 3. Minimize interruptions during sign-out by restructuring workflow.

7

8 Secondary research identified eight systematic reviews supporting the use of sign-out tools to  
9 reduce adverse events.<sup>18-20</sup> We also reviewed an article detailing the development of our  
10 institution's original template, which highlighted similar challenges.<sup>21</sup>

11

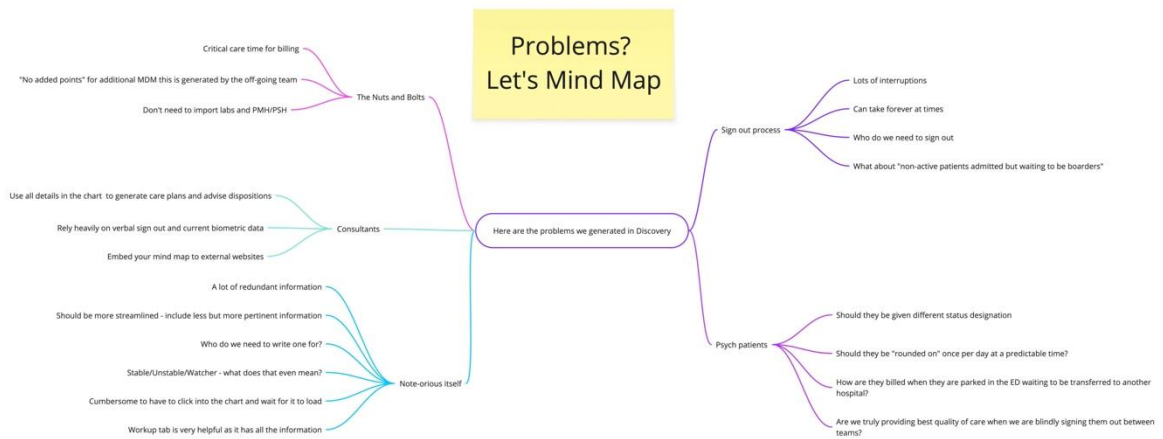

12 During brainstorming sessions, the most frequently used techniques were storytelling and  
13 "*How Might We*" questions, which were used to foster empathy and innovation. Low-fidelity  
14 prototypes were created as electronic medical record (EMR) dot phrases and iteratively  
15 refined based on resident feedback and direct observation.

16

17 The five-question survey was repeated post-implementation, with response rates of 93%  
18 (31/33) for residents and 6% (3/49) for attendings. Qualitative analysis identified three  
19 themes:

- 20 1. The redesigned template was simpler and more desirable.
- 21 2. Residents requested reminders for note completion.

1            3. A department-wide understanding of protected sign-out time was needed.

2

3            *Figure 1 – Mind Map*

4

5            Three broad themes were identified as opportunities for solution generation.

6            1. The note template needed to be redesigned to reduce redundancy while meeting  
7            requirements for billing and communication.

8            2. Our clinicians needed to have defined plans for patients that can be enacted by  
9            receiving physicians, and this should be clear in the template.

10           3. We needed to restructure the way we sign out to ensure interruptions from ED staff  
11           were minimized.

12

13           Our secondary research, in the form of a literature search, found 8 systematic reviews that  
14           were analyzed in full. Our review showed that sign-out tools are associated with a reduced  
15           risk of adverse events for the patient.<sup>18-20</sup> We also found a paper that explained how our  
16           institution's current note template was developed.<sup>21</sup> This article demonstrated that similar  
17           issues were present when our original note template was designed. Appendix 2 shows the  
18           literature review.

19

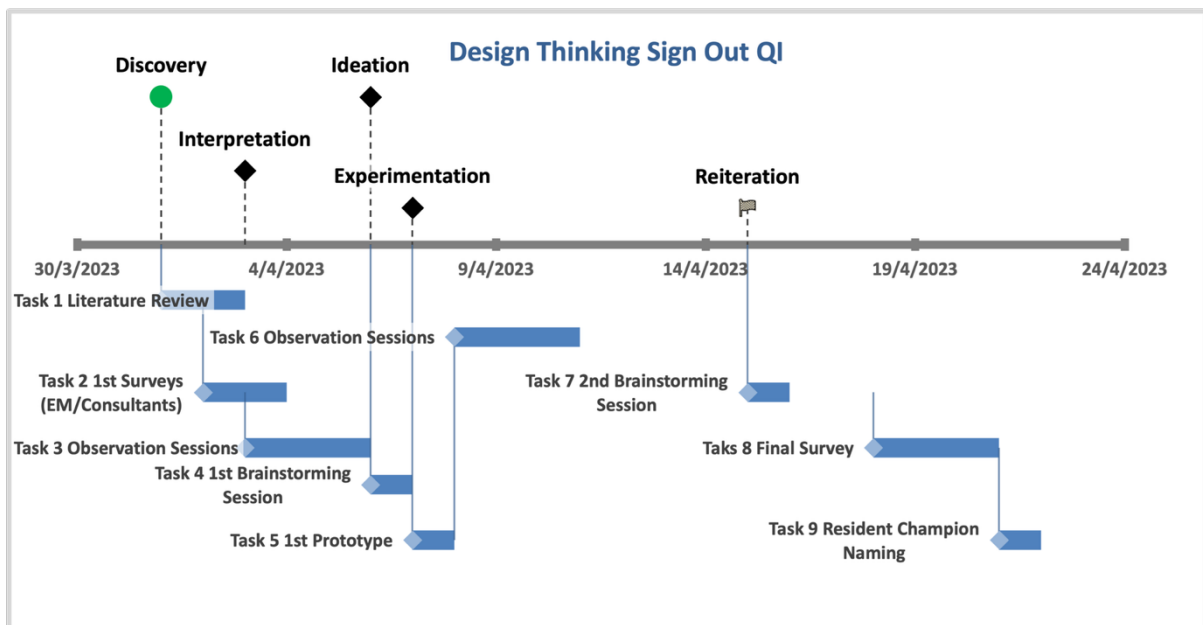

1 The two most utilized techniques during brainstorming sessions were storytelling and the  
 2 “how might we” question. The lead investigator synthesized the primary and secondary  
 3 research into a “story” about sign-out to ensure designers empathized with end users as they  
 4 developed solutions. We created low-fidelity prototypes as dot phrases in the EMR for our  
 5 identified resident users and made small changes to the template based on feedback and  
 6 direct observation.

7

8 The five-question survey (Appendix 1) was repeated to the same residents and faculty, with  
 9 response rates of 93% (31/33) and 6% (3/49), respectively. Qualitative analysis showed three  
 10 main themes:

- 11 1. The note template was simplified and more desirable.
- 12 2. Residents need a way to be reminded about note completion.
- 13 3. We need to have a department-wide understanding that sign-out time is protected.

14

15

16 Figure 2 – Milestone and Task Control Chart

17

18 **DISCUSSION**

1 This QI project employed an HCD framework to develop, test, and refine a prototype that  
2 enhanced end-user workflow, as indicated by qualitative survey feedback. The design cycle  
3 was completed within three weeks, producing a solution that was perceived as desirable by  
4 stakeholders.

5  
6 A key strength of using HCD is its ability to rapidly develop and refine prototypes based on  
7 real-time user feedback. For GME educators, HCD frameworks align well with ACGME core  
8 competencies, including practice-based learning and improvement, system-based practice,  
9 interpersonal and communication skills, and professionalism. Additionally, this approach  
10 supports the ACGME Clinical Learning Environment Review program, which emphasizes  
11 patient safety, QI, and transitions of care.<sup>22</sup>

12  
13 Creativity and problem-solving are learnable skills, and Design Thinking (DT) equips  
14 clinicians with tools to strengthen both.<sup>10,12,23-25</sup> In this project, techniques such as storytelling  
15 and “*How Might We*” questions helped designers empathize with end-users and synthesize  
16 insights. This is particularly important because traditional medical solutions often prioritize  
17 input from senior or vocal stakeholders and have low tolerance for failure. Our secondary  
18 research revealed that the original sign-out template was well-constructed but failed to  
19 address underlying workflow issues. HCD encourages divergent thinking to explore user  
20 needs before converging on solutions, ensuring outcomes that are both desirable and feasible,  
21 and sustainable. DT provides a structured process and mindset shift to achieve these goals.

22  
23 This case study did not include quantitative measures. Future projects should assess metrics  
24 such as sign-out duration, rates of sign-out-related complications, and pre-post comparisons

1 of workflow efficiency. This data would provide a more robust evaluation of the impact of  
2 HCD-designed solutions.

3

#### 4 **CONCLUSION**

5 This report demonstrates how DT can be applied to solve real-world clinical challenges  
6 within the QI framework in GME. Familiarity with HCD principles and tools empowers  
7 learners to design solutions that improve workflows and communication, ultimately  
8 benefiting patients, colleagues, and healthcare systems.

31

32

1 **Appendix 1**

2 *Discovery - 5 Question Survey using Survey Monkey:*

- 3 1. How is the ED to ED provider sign-out process working for you?
- 4 2. How is the current IPASS note?
- 5 3. Are there any areas of improvement that could be made to the IPASS note?
- 6 4. Are there areas of strength to the IPASS note? What do you like/dislike?
- 7 5. Do you have any general thoughts/feedback on the IPASS note?

8 49 Faculty – 5 responses (10% response rate)

9 33 Residents – 27 responses (81% response rate)

10

11 *Discovery – 3 Question Survey using Survey Monkey:*

- 12 1. Did you know that there are two notes utilized by physicians in the Emergency
- 13 Department? The ED Provider Note and the IPASS Note (used for sign-out between
- 14 ED providers).
- 15 2. Do you use any of the notes to guide your care of patients and your
- 16 recommendations?
- 17 3. How can we make our notes better to make taking care of the patients more effective
- 18 and efficient?

19 3 Consultant Residents – General Surgery, Neurology, Internal Medicine (100% response

20 rate)

21

22

1 **Appendix 2**

2 *Literature Review*

3 In April of 2023 we performed a search of PubMed (Emergency Department) AND  
4 (((((handoffs) OR (inter-shift transition of care)) OR (standardized handoffs)) OR  
5 (standardized ed handoff)) OR ((implementation of standardized handoffs) OR  
6 (standardization of inter-shift handoffs))) filtered by “systematic review” within the last 10  
7 years (2013-2023). This yielded 11 articles, with 4 articles excluded based on relevance. 7  
8 manuscripts were reviewed in full, and after review of references, 1 additional article was  
9 added due to significant relevance to the current project.
